

Feedback document

Things that did not make sense to you and you think should be improved (with a suggestion)

- The modules in Chapter 4 are well described and easy to follow. However, the connection between the modules and the architectural layers is a bit unclear. It could be improved by clearly defining which modules belong to which layer.
- The ER diagram and database schema section is clear and well made, but it goes too deep into implementation details. It shows a lot of technical database information that is not needed in the design stage. It could be improved by focusing more on providing a conceptual overview of the main entities and their relationships, rather than showing detailed implementation data.
- The activity diagram section is visually clear but far too detailed. Having a separate diagram for each requirement makes the document long and repetitive. It could be improved by showing only a few key workflows at a higher level to illustrate the main system interactions
- The complete system UML(chap 4.1) appears to be quite complicated, we believe this could benefit from brief description or at least make it more obvious to read where you're describing them. Such as clearer images above bullets in sub-sections.
- I'm not sure I understand how the C4 model is implemented. In the report there is no description or figure of this and how it is implemented.
- The UI section is well described in the section but mockups or sketches to support it visually would have made good sense.

Things you like and would potentially steal for your improvement of your document.

- The SOLID principles were well explained and clearly connected to your actual implementation design. This works very well and provides a clear conceptual understanding of how the system would function in practice, even without going into low-level implementation details.
- Use of different models from our software architecture is planned to be implemented and shows a good understanding for how to build applications.
- Although the database schematic section is quite implementation-level, it also provides a good overview of the main entities and their relationships. We already have an ER diagram, but we plan to add a short description of the entities and their relationships without going into low-level details.
- The other group's Architecture and Design document is generally more structured and easier to follow. As an improvement, we could organize our own document in a similar way by dividing sections more clearly and keeping a consistent level of detail throughout.
- Section "13 Review and Revision", mentions all updates will be version controlled and documented in a change log for transparency and traceability. Should this prove relevant, it seems like a great idea to steal for the exact reasons they themselves mention.
